

Dendrometer MIJ-02 Rotary Type3

Optional Floating Mount Kit

Floating mount kit for MIJ-02 Rotary Type 3. When Type3 is fixed with the attached 25mm screw, the arm may be buried in the trunk (the arm may sink into the trunk) in fast-growing tree species. An optional floating mount kit used to prevent this burial.

Normal screw installation

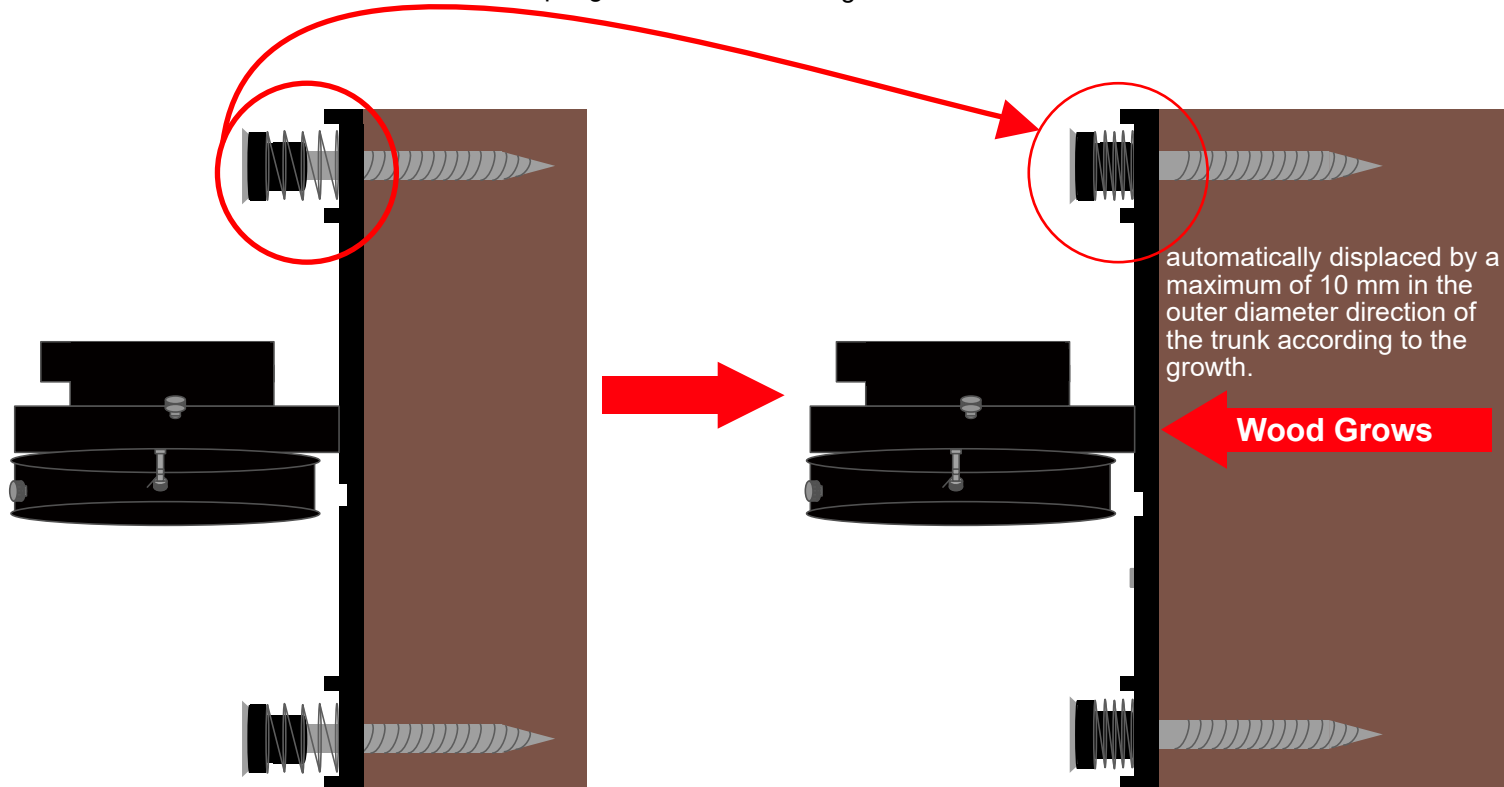

State left for a long time

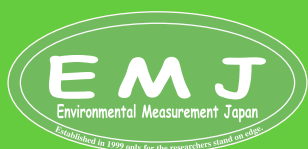

If the growth rate of the tree is extremely fast, the dendrometer may be buried into the tree and stop functioning.

Optional Floating Mount Kit

When this floating mount kit is attached to the two fixing holes of the arm, it can be fixed to the trunk with a 35mm screw, and the arm is float-mounted from the trunk by the contraction of the spring charged in the screw. The structure is such that the arm is automatically displaced by a maximum of 10 mm in the outer diameter direction of the trunk according to the growth.

By using a floating mount, the arm automatically displaces in the outer diameter direction of the trunk according to the growth of the tree, so it is possible to prevent burial.
